

Web Development with Python (CS-205)
August, 2025

Time allowed: 1 hour 30 minutes

1. Consider the following scenario:

You are a developer at WONDERLAND Company which mainly focuses on creation of web sites using Python with Django Framework. There are many developers in this company, and they are working in groups to develop the web sites. Now your group is assigned to create a **Student Information System**. Your group members are developing different components under the guidance of the group leader. Today, your responsibility is to create the data model for the student information system. And then fill data from your entry page and retrieve all teacher information on your display page. This is only a part of the whole system. The group leader asked you to create the data model as follows:

DATABASE DESIGN	
Teachers	Classes
- TeacherName - Departments - Position - Phone - Email	- CourseCode - DayOfWeek - TimeStart - TimeEnd - Teacher

For example, CourseCode fields are CS-205, CS-401, IS-411, etc. Departments are FCS, FIS, FCST, ITSM, etc. One teacher can have more than one class.

According to this data model, you need to develop the following pages:

- (1) To fill in the classes' information.
- (2) To display a list of all teachers who work under FCS department.
- (3) To display a list of teachers who teach CS-205 course.
- (4) To display a list of all classes on Monday.

All teachers' lists must be sorted by name. Teacher information will be added from Admin site. Be sure that your pages will work only on valid data.
